

Conclusion

The compounds were able to change during each shift. we were able to determine the hydration and were able to see the change when it went through shifts with color and texture. Some of the compounds did lose water and some of them gained. we were able to see some went back to how they started despite the different changes it underwent. we also had to calculate the mass and figure out the formula of hydrate. with our observations we could classify the compounds with the given mass as well.
